我国原花蝽属新种记述

(半翅目: 花蝽科)*

ト文俊 郑 乐 怡 (南开大学生物系,天津)

原花蝽属 (Anthocoris Fallen) 在花蝽科中种类较多而且常见,我国已记载 19 种。本文记述 2 个新种。文中所用长度单位为 mm。

秦岭原花蝽 Anthocoris qinlingensis 新种(图 1-4)

头黑,长 0.50,宽 0.52,眼前部分长:眼前缘以后部分长=1:1。触角第1节、第2节端部1/4以及第4节黑褐,第2节基部3/4黄褐,第3节基半黄褐或全部黑褐,各节毛长不超过该节直径,各节长 0.22:0.64:0.42:0.42。前胸背板黑色,长 0.58,领宽 0.48,后缘宽 1.18,毛被短,平伏;侧缘几不伸出,前角处平缓,胝后缘凹陷较浅,胝后横皱明显,延至背板后缘。前翅革质部全具光泽,毛被短,平伏;爪片淡黄白,基部、内缘及端部褐色,界限模糊;革片基半淡色,内革片端半为深褐色,此斑外缘直,外革片在楔片缝前为一大黑斑,革片端缘褐色,楔片大部色较淡,外缘色深,向后逐渐加重(图 4),膜片色斑如图 1;外革片长 1.28, 楔片长 0.78,膜片长 1.55。足黄色,股节黄褐至黑褐或在端部有褐色环,胫节基部有时加深为黑褐色。体长 3.7—4.1,宽 1.2—1.4。雄虫抱器宽大,内侧缘有两处突起,亚端部的突起较大。

正模♂,配模♀: 陕西秦岭,1916. VIII. 22, C. C. Licent 采。副模 5 ♂♂,3 ♀♀, 陕西(秦岭、华山)。

属于 nemorum 群(分群意见按 Pericart, 1972)。体形、构造、色斑类型均似 A. montanus Zheng,但较宽大,前翅深色部分色较淡,多数个体革质部中段黑斑不成横带状(montanus 该处黑斑连续成横带状(图 5))。抱器明显不同。

横带原花蝽 Anthocoris fasciatus 新种(图 6)

黑,全体具光泽。头较狭长,长 0.46,宽 0.42; 眼前部分长:眼前缘以后部分长 = 12: 11,头顶中部光滑无毛;触角黑褐,第 2 节基部 3 / 4 黄褐,各节长 0.14:0.50:0.26:0.32, 其上毛长不超过该节直径。前胸背板长 0.46,领宽 0.38,后缘宽 0.86,领皱刻清楚,侧缘稍凹,前角平缓; 胝区面积较大,约占据整个前胸背板的前半,光滑少毛, 胝区后缘下陷较深; 胝后区域横皱明显,达于后缘,毛较长,长约达复眼直径之半,直立或半直立。前翅色斑炎型在本属中极为特殊: 爪片基部及亚端部、革片亚端部、楔片大部为黑褐色,其余部分淡色;整个前翅革质部外观呈两端黑色,中间为一黑色横带;布有稀疏的直立、半直立长毛,

本文于 1987 年 4 月收到。

1.背面观 2-3.抱器 4.前翅
图 5 山地原花蝽 Anthocoris montanus Zheng 前翅
图 6 横带原花蝽 Anthocoris fasciatus sp. nov. 背面观

毛长达复眼直径之半;膜片灰褐色,内角和亚端部有白斑;外革片长 1.04,楔片长 0.54, 膜片长 1.32。各足基节、股节、以及后足胫、跗节黑褐;前足胫节黄褐;中足胫节端部黄褐,向基部渐深至黑褐色;后足胫节刺长可稍过该节直径。体长 3.07,宽 0.93。

正模 9: 云南武定狮子山 (2300m), 1986. VIII.10, 刘国卿采。

本种与分布于中国和日本的 A. miyamotoi Hiura 以及分布于缅甸的 A. distanti Kiritschenko 相近,均为体较狭细,全体光泽很强、色斑鲜明的种类,但触角比例以及前翅色斑均明显不同。

NEW SPECIES OF GENUS ANTHOCORIS FROM CHINA (HEMIPTERA: ANTHOCORIDAE)*

Bu Wen-jun & Zheng Le-Yi
(Department of Biology, Nankai University, Tianjing)

Two new species of Genus Anthocoris are described in this paper. The type specimens are deposited in Nankai University. All the measurements are in millimetres.

Anthocoris qinlingensis Bu et Zheng sp. nov. (Figs. 1,2,3,4)

Brown; 2nd antennal seg. except apex, base of 3rd antennal seg. and tibia ochraceous, or base of 3rd antennal seg. and base of tibia piceous; hemelytra shining, color pattern as in fig. 4; femur brownish to piceous. Paramere broad, inner lateral margin swelled in two places, the subapical swelling stronger (figs. 2,3,). Pubescence short and decumbent. Body length 3.6—4.2, width 1.2—1.4; antennal seg. lengths 0.22:0.64:0.42; length exocorium 1.28, cuneus 0.78.

Closely allied to A. montanus Zheng in boly form, structure of pronotum, and color pattern of hemelytra. Differences are: new species body broader, coloration lighter, the median dark fascia on hemelytra non-continuous (fig. 4). but in montanus is a continuous transverse band (fig. 5); paramere differently shaped.

Holotype σ^2 : Shaanxi (Qinling 33°50'N, 1117°40'E), 1916. VIII. 22.; allotype \mathcal{P} , paratypes 5 $\sigma^2\sigma^2$ 3 $\mathcal{P}\mathcal{P}$: as above.

Anthocoris fasciatus Bu et Zheng sp. nov. (Fig. 6)

Body slender. Black; 2nd antennal seg. except apex ochraceous; hemelytra shining, base and apex black, median transverse band black; color pattern as in Fig. 6; femur and hind tibia piceous, fore tibia ochraceous, middle tibia ochraceous to piceous. Pubescence long and erect or semi-erect. Body length 3.07, width 0.93; antennal seg. lengths 0.14:0.50:0.26:0.32; length exocorium 1.04, cuneus 0.54.

Allied to A. miyamotoi Hiura (from China and Japan) and A. distanti Kiritschenko (from Burma) in having slender body form, strong lustre and distinct color spots; but differs clearly from them in the proportion of antennal segment lengths and color pattern of fore wing.

Holotype 2. Yunnan (Wuding 26°N, 102°40 E), 1986. VIII. 10.
